

Real-Time Video Display for Schools and Campuses

Secure Display Stations are ultra-compact, tamper-proof appliances that allow educational institutions to display live video feeds on any monitor from virtually any camera. They enhance situational awareness for both security and operational needs, giving staff better oversight and real-time visibility across campus.

Whether integrated with a video management system or used standalone, Secure Display Stations are simple to operate, even for non-security personnel, helping create safer environments. They can be installed in key areas such as main entrances, administrative offices, or security rooms to maximize visibility. This proactive approach enables quicker incident response and improved day-to-day campus operations.

Enhance School and Campus Security with Live Video

The Secure Display Station is a simple way to bring live video to virtually any location without the cost, complexity and security risk of a security client workstation. With plug-and-play installation and broad compatibility, it's easy to deploy in both new and existing infrastructure. Designed for reliability and flexibility, it ensures continuous video access where it matters most.

How It Works

The Secure Display Station is a plug-and-play solution designed to bring live video to any location quickly, securely, and without the complexity of a traditional workstation.

It features HDMI outputs to connect up to three monitors and two network ports for connecting to your local camera network and the internet for remote management. A connectivity kit, including a USB-to-Ethernet adapter, is also available for added deployment flexibility.

Once connected, the device automatically detects all available cameras on the network. You can then select video sources, configure layouts, set viewing sequences, and more. Batch configuration, health monitoring, and software updates can all be managed remotely through the PERCEPT Cloud platform, which also offers live preview and geolocation for your entire device fleet.

The Secure Display Station is an open-platform device, meaning it is not locked to a specific camera brand. It supports the majority of security cameras on the market using the industry-standard ONVIF protocol, ensuring maximum compatibility with your existing infrastructure.

The Secure Display Station also integrates with Genetec™ Security Center and Milestone XProtect, allowing you to manage your live video solution directly from your video management system.

What's Needed

The Secure Display Station is a turnkey device designed for fast and simple deployment in any environment where live video monitoring is required. To get started, you'll need at least one Secure Display Station per display location. The device connects to your local camera network and the internet if you need cloud-based remote configuration and management.

A VESA mount is included for quick and easy installation behind a monitor, allowing the Secure Display Station to be discreetly and securely mounted in virtually any environment.

No additional servers or software are required onsite. It does not require any additional software licenses to function as a stand-alone video display solution, but it can also be fully integrated into your existing video management system.
